这是适用于问题求解作业的 Typst 模板, 也可用于其他类型的作业与报告等。 该模板仍在进行测试中, 请谨慎使用。

# 1 作业(必做部分)

# Problem 1 (AC 1.2-3)

## **Solution:**

1 Lorem ipsum dolor.

- a) when  $\min(\|x\|_2)$ ,  $x=x^*$  is the solution to the problem, which is  $x^*=\begin{pmatrix} \frac{1}{\sqrt{3}} \\ \frac{1}{\sqrt{3}} \\ \frac{1}{\sqrt{3}} \end{pmatrix}$
- b) We have a matrix  $A = \begin{pmatrix} 1 & 1 \\ 1 & 1 \\ 1 & 0 \end{pmatrix}$ , the projection operator is

$$P = A(A^T A)^{-1} A^T = \begin{pmatrix} \frac{1}{2} & \frac{1}{2} & 0 \\ \frac{1}{2} & \frac{1}{2} & 0 \\ 0 & 0 & 1 \end{pmatrix},$$

hence,

$$x^* = Pv = egin{pmatrix} rac{1}{2} \ rac{1}{2} \ 1 \end{pmatrix}.$$

2 Lorem ipsum dolor sit amet.

c) We have a matrix  $A = \begin{pmatrix} 1 & -1 \\ -1 & 1 \\ 2 & 2 \end{pmatrix}$ , the projection operator is

$$m{P} = m{A} m{(A^T A)}^{-1} m{A}^T = egin{pmatrix} rac{1}{2} & -rac{1}{2} & 0 \ -rac{1}{2} & rac{1}{2} & 0 \ 0 & 0 & 1 \end{pmatrix},$$

hence,

$$oldsymbol{x}^* = oldsymbol{P}oldsymbol{v} = egin{pmatrix} rac{1}{2} \\ -rac{1}{2} \\ 0 \end{pmatrix}.$$

## **Problem 2**

#### **Solution:**

1. we know that:

$$\mathrm{prox}_{\varphi}(z) = \mathrm{arg} \, \mathrm{min}_{x \in \mathbb{R}} \Big\{ \frac{1}{2} \|x-z\|^2 + \phi(x-c) \Big\}.$$

$$let x' = x - c$$

$$\mathrm{prox}_{\varphi}(z) = \mathrm{arg\,min}_{x \in \mathbb{R}} \left\{ \frac{1}{2} \|x' - (z-c)\|^2 + \phi(x'+c-c) \right\} + c = \mathrm{prox}_{\phi}(z-c) + c.$$

2. if we want to  $f(x) = \frac{1}{2}||x - z||^2 + \phi(x)$  to be minimized, we need to find the x that makes the derivative of the function equal to zero.

we know

$$\partial f(x) = \begin{cases} x - z + \lambda \text{ when } x > 0\\ [x - z - \lambda, x - z + \lambda] \text{ when } x = 0\\ x - z - \lambda \text{ when } x < 0 \end{cases}$$

. Hence, let

$$\partial f(x) = 0$$

, we have

$$\operatorname{prox}_{\phi(z)} = x^* = \begin{cases} z - \lambda \text{ when } z > \lambda \\ [z - \lambda, z + \lambda] \text{ when } z \in [-\lambda, \lambda]. \\ z + \lambda \text{ when } z < -\lambda \end{cases}$$

3. if  $\varphi(x) = \lambda |x - c|$ , where  $c \in \mathbb{R}$  and  $\lambda > 0$ . Use the result from part a.

$$\mathrm{prox}_{\varphi(z)} = \mathrm{prox}_{\phi(z-c)} + c = \begin{cases} z - \lambda \text{ when } z > \lambda + c \\ [z - \lambda, z + \lambda] \text{ when } z \in [-\lambda + c, \lambda + c] \\ z + \lambda \text{ when } z < -\lambda + c \end{cases}$$

### **Problem 3**

#### **Solution:**

1. If we take the derivative of  $\frac{1}{2}\|x-x^{t-1}\|^2+\gamma g(x)$ , we have

$$x^t = \text{prox}_{\gamma g}(x^{t-1}) = x^{t-1} - \gamma \nabla g(x^t)$$

2. By the convexity of g, we know that  $g(x^t) + \nabla g(x^t)^T (x^{t-1} - x^t) \leq g(x^{t-1})$ . Hence, we have

$$g(\boldsymbol{x^t}) \leq g(\boldsymbol{x^{t-1}}) - \nabla g(\boldsymbol{x^t})^T(\boldsymbol{x^{t-1}} - \boldsymbol{x^t}) = g(\boldsymbol{x^{t-1}}) - \gamma \nabla \left\|g(\boldsymbol{x^t})\right\|_2^2$$

3. because  $x^t = x^{t-1} - \gamma \nabla g(x^t)$  which is a gradient descent method, so

$$-\infty < g(\boldsymbol{x}^t) \leq g(\boldsymbol{x}^{t-1})$$

and we have

$$g(\boldsymbol{x^t}) \leq g(\boldsymbol{x^{t-1}}) - \gamma \nabla \big\| g(\boldsymbol{x^t}) \big\|_2^2$$

hence

$$0 \le \gamma \nabla \|g(x^t)\|_2^2 \le 0$$

if

$$t \to +\infty$$

# **Problem 4 (ST 5.5-5)**

#### **Proof:**

1. because

$$\begin{split} \partial f(\boldsymbol{x}) &= \left\{ \boldsymbol{v} \in \mathbb{R}^n : f(\boldsymbol{y}) \geq f(\boldsymbol{x}) + \boldsymbol{v}^T(\boldsymbol{y} - \boldsymbol{x}), \forall \boldsymbol{y} \in \mathbb{R}^n \right\} \\ \text{if } g(\boldsymbol{x}) &= \theta f(\boldsymbol{x}), \\ \partial g(\boldsymbol{x}) &= \left\{ \boldsymbol{v} \in \mathbb{R}^n : g(\boldsymbol{y}) \geq g(\boldsymbol{x}) + \boldsymbol{v}^T(\boldsymbol{y} - \boldsymbol{x}), \forall \boldsymbol{y} \in \mathbb{R}^n \right\} \\ \partial g(\boldsymbol{x}) &= \left\{ \boldsymbol{v} \in \mathbb{R}^n : \theta f(\boldsymbol{y}) \geq \theta f(\boldsymbol{x}) + \boldsymbol{v}^T(\boldsymbol{y} - \boldsymbol{x}), \forall \boldsymbol{y} \in \mathbb{R}^n \right\} \\ \partial g(\boldsymbol{x}) &= \left\{ \boldsymbol{v} \in \mathbb{R}^n : f(\boldsymbol{y}) \geq f(\boldsymbol{x}) + \frac{\boldsymbol{v}^T}{\theta}(\boldsymbol{y} - \boldsymbol{x}), \forall \boldsymbol{y} \in \mathbb{R}^n \right\} \\ \partial g(\boldsymbol{x}) &= \theta \{ \boldsymbol{v} \in \mathbb{R}^n : f(\boldsymbol{y}) \geq f(\boldsymbol{x}) + \boldsymbol{v}^T(\boldsymbol{y} - \boldsymbol{x}), \forall \boldsymbol{y} \in \mathbb{R}^n \} = \theta \partial f(\boldsymbol{x}) \end{split}$$

2.

$$\partial h(\boldsymbol{x}) = \left\{\boldsymbol{v} \in \mathbb{R}^n : f(\boldsymbol{y}) + g(\boldsymbol{y}) \geq f(\boldsymbol{x}) + g(\boldsymbol{x}) + \boldsymbol{v}^T(\boldsymbol{y} - \boldsymbol{x}), \forall \boldsymbol{y} \in \mathbb{R}^n \right\}$$

all of the elements that satisfy

$$f(y) \ge f(x) + v^T(y - x), \forall y \in \mathbb{R}^n$$

and

$$g(\boldsymbol{y}) \geq g(\boldsymbol{x}) + \boldsymbol{v}^T(\boldsymbol{y} - \boldsymbol{x}), \forall \boldsymbol{y} \in \mathbb{R}^n$$

are in the set

$$\partial h(x)$$

hence

$$\partial f(x) + \partial g(x) \subseteq \partial h(x)$$

3. we know that

$$\partial \|x\|_1 = \begin{cases} 1 \text{ when } x > 0 \\ [-1,1] \text{ when } x = 0 \\ -1 \text{ when } x < 0 \end{cases}$$

hence  $sgn(x) \in \partial ||x||_1$ .

### **Problem 5**

#### **Solution:**

中文排印测试:

Here's a test sentence, "I can eat glass, it does not hurt me."

这是一条测试语句: "我能吞下玻璃而不伤身体。"

這是一條測試語句:「我能吞下玻璃而不傷身體。」

默認使用 "Noto Serif", "IBM Plex Serif" 字形,並且設置語言為 "zh", 地區為 "cn"。

目前的效果是,當引號"兩邊有 CJK 字符,引號將以半角顯示",否則正常顯示英文引

號。

測試: "中文引號", "quotation marks".

## Problem 6

#### **Solution:**

```
This a test for code blocks.
    For rust:
                                                                         rust
1 pub fn main() {
 2
       println!("Hello, world!");
3 }
   Highlight some lines:
                                                                       python
1 import numpy as np
 3 def fibonaci(n):
 4 if n ≤ 1:
 5
      return n
 6 else:
 7    return(fibonaci(n-1) + fibonaci(n-2))
9 fibonaci(10)
    Commenting some lines and adding header and footer:
                                                                       python
 This is a test for zebraw.
1 import numpy as np
 2
3 def fibonaci(n):
    if n \leq 1:
5 return n
 6
     else:
```

Then pseudocodes.

# Algorithm 1: The Euclidean algorithm

**input:** integers a and b

**output:** greatest common divisor of a and b

1 while  $a \neq b$  do

```
\begin{array}{c|c}
2 & \text{if } a > b \text{ then} \\
3 & a \leftarrow a - b
\end{array}
```

4 else

$$5 \mid b \leftarrow b - a$$

6 end

comment test

> another comment test

7 **end** 

8 return a

## Algorithm 1

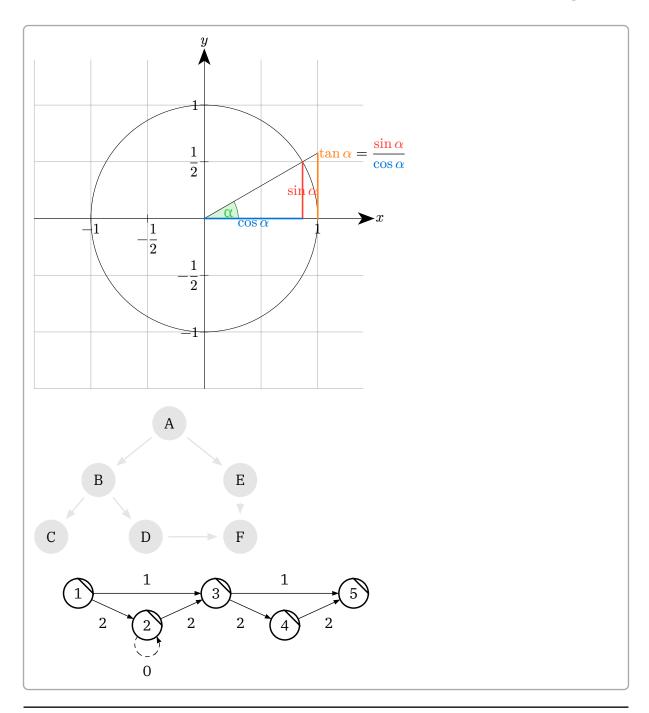

In Line 1, we have a while loop.

The algorithm figure's breakable.

# Problem 7 ()

This is a test for CeTZ.

## **Solution:**

# 2 作业 (选做部分)

# Problem 1 (EoSD 9961)

How to pass 「レッドマジック」?

# **Solution:**

Practice more.
